

NAME

CURLINFO_CONDITION_UNMET – get info on unmet time conditional

SYNOPSIS

```
#include <curl/curl.h>
```

```
CURLcode curl_easy_getinfo(CURL *handle, CURLINFO_CONDITION_UNMET, long *unmet);
```

DESCRIPTION

Pass a pointer to a long to receive the number 1 if the condition provided in the previous request didn't match (see *CURLOPT_TIMECONDITION(3)*). Alas, if this returns a 1 you know that the reason you didn't get data in return is because it didn't fulfill the condition. The long this argument points to will get a zero stored if the condition instead was met.

PROTOCOLS

HTTP and some

EXAMPLE

TODO

AVAILABILITY

Added in 7.19.4

RETURN VALUE

Returns CURLE_OK if the option is supported, and CURLE_UNKNOWN_OPTION if not.
