

**NAME**

CURLINFO\_CONTENT\_TYPE – get Content-Type

**SYNOPSIS**

#include &lt;curl/curl.h&gt;

CURLcode curl\_easy\_getinfo(CURL \*handle, CURLINFO\_CONTENT\_TYPE, char \*\*ct);

**DESCRIPTION**

Pass a pointer to a char pointer to receive the content-type of the downloaded object. This is the value read from the Content-Type: field. If you get NULL, it means that the server didn't send a valid Content-Type header or that the protocol used doesn't support this.

The **ct** pointer will be NULL or pointing to private memory you MUST NOT free it - it gets freed when you call *curl\_easy\_cleanup(3)* on the corresponding CURL handle.

**PROTOCOLS**

HTTP(S)

**EXAMPLE**

TODO

**AVAILABILITY**

Added in 7.9.4

**RETURN VALUE**

Returns CURLE\_OK if the option is supported, and CURLE\_UNKNOWN\_OPTION if not.
