#### **NAME**

CURLOPT\_TIMEOUT - set maximum time the request is allowed to take

## **SYNOPSIS**

#include <curl/curl.h>

CURLcode curl\_easy\_setopt(CURL \*handle, CURLOPT\_TIMEOUT, long timeout);

## DESCRIPTION

Pass a long as parameter containing *timeout* - the maximum time in seconds that you allow the libcurl transfer operation to take. Normally, name lookups can take a considerable time and limiting operations to less than a few minutes risk aborting perfectly normal operations. This option may cause libcurl to use the SIGALRM signal to timeout system calls.

In unix-like systems, this might cause signals to be used unless CURLOPT\_NOSIGNAL(3) is set.

If both CURLOPT TIMEOUT(3) and CURLOPT TIMEOUT MS(3) are set, the value set last will be used.

Since this puts a hard limit for how long time a request is allowed to take, it has limited use in dynamic use cases with varying transfer times. You are then advised to explore  $CURLOPT\_LOW\_SPEED\_LIMIT(3)$ ,  $CURLOPT\_LOW\_SPEED\_TIME(3)$  or using  $CURLOPT\_PROGRESSFUNCTION(3)$  to implement your own timeout logic.

## **DEFAULT**

Default timeout is 0 (zero) which means it never times out during transfer.

# **PROTOCOLS**

All

#### **EXAMPLE**

```
CURL *curl = curl_easy_init();
if(curl) {
  curl_easy_setopt(curl, CURLOPT_URL, "http://example.com");

/* complete within 20 seconds */
  curl_easy_setopt(curl, CURLOPT_TIMEOUT, 20L);

curl_easy_perform(curl);
}
```

# **AVAILABILITY**

Always

## **RETURN VALUE**

Returns CURLE\_OK

# **SEE ALSO**
