# NAME

curl\_multi\_cleanup - close down a multi session

### **SYNOPSIS**

## #include <curl/curl.h>

#### CURLMcode curl\_multi\_cleanup( CURLM \*multi\_handle );

## DESCRIPTION

Cleans up and removes a whole multi stack. It does not free or touch any individual easy handles in any way - they still need to be closed individually, using the usual  $curl_easy_cleanup(3)$  way. The order of cleaning up should be:

1 - *curl\_multi\_remove\_handle(3)* before any easy handles are cleaned up

2 -  $curl_easy_cleanup(3)$  can now be called independently since the easy handle is no longer connected to the multi handle

3 - *curl\_multi\_cleanup(3)* should be called when all easy handles are removed

## **RETURN VALUE**

CURLMcode type, general libcurl multi interface error code. On success, CURLM\_OK is returned.
